the awareness and development of biodegradable surfactants pre dates current pressures by the environmental movement by nearly three decades wherein a responsible industry mutually agreed to replace hard non biodegradable components of household detergents by soft biodegradable alternatives without course to legislation the only requirement at that time was for surfactants used in detergents to exhibit a primary biodegradability in excess of 80 this referring to the disappearance or removal from solution of the intact surface active material as detected by specified analytical techniques this proved useful as observed environmental impacts of surfactants e.g visible foam on rivers are associated with the intact molecule test methods for primary biodegradability were eventually enshrined in eu legislation for nonionic surfactants directive 82/1242/EEC amended 73/404/EEC and for anionic surfactants directive 82/1243/EEC amended 73/405/EEC no approved test methods and resultant legislation have been developed for cationic and amphoteric surfactants to date the environmental classification of chemical substances which of course includes surfactants and associated risk assessment utilises a second criterion ready biodegradability this may be assessed by a number of methods which monitor oxygen uptake bod carbon dioxide production or removal of dissolved organic carbon doc some surfactants which comply with the above detergents directive are borderline when it comes to ready biodegradability
